

Cloud Infrastructure Home

About this project

The Cloud infrastructure team focuses on cloud infrastructure technologies such as Kubernetes, OpenStack, Ceph, and container runtime.

We dedicate to make open-source cloud infrastructure projects have the capabilities of easy deployment, easy management, and good performance on Arm64.

We also run the Linaro Developer Cloud. It is a pure open-source cloud, free for developers. It offers the virtual machine instances and Kubernetes as a service. Link: www.linaro.cloud
